

GN03016

PATENT

IN THE CLAIMS

Please amend the claims as follows.

1. (currently amended) A method for printing grey scale images on a printing medium, the method comprising:
delivering ~~at least~~ a first number of first droplets of printing material of a colour with a first volume from a first printhead, the first printhead having only first marking elements for delivering said first droplets of a single volume equal to said first volume, said first marking elements positioned at a fixed pitch from each other; and
delivering a second number of second droplets of printing material of ~~that~~ a second colour with a second volume from a second printhead, the first volume and the second volume being different, the second printhead having only second marking elements for delivering said second droplets of a single volume equal to said second volume, said second marking elements positioned at said same fixed pitch from each other; and
merging together depositing said first number of first droplets and said second number of second droplets at exactly the same place on a target pixel position on the printing medium to obtain a given greyscale dot on the printing medium, the method forming greyscale dots at said same fixed pitch on the printing medium.
2. (cancelled)
3. (original) A method according to claim 1, furthermore comprising a dithering step to increase the number of reproducible grey scale tones.
4. (original) A method according to claim 1, furthermore comprising a dithering step to locally mask defects in generating a

greyscale dot.

5. (original) A method according to claim 1, the first printhead and the second printhead respectively having a first and a second intrinsic droplet frequency, a nominal printing frequency of the printing method being the lowest of the first and the second intrinsic droplet frequencies, the method further comprising printing at the nominal printing frequency.
6. (original) A method according to claim 1, the first printhead and the second printhead respectively having a first and a second intrinsic droplet frequency, a nominal printing frequency of the printing method being the lowest of the first and the second intrinsic droplet frequencies, the method further comprising printing at a printing frequency which is lower than the nominal printing frequency.
7. (original) A method according to claim 6, wherein the printing frequency is at least 5 kHz and the number of droplets that can be delivered at a pixel position by each printhead is at least two.
8. (currently amended) An ink jet printer suitable for printing grey scale images onto a printing medium, the printer comprising:
 - at least a first printhead and a second printhead for a colour, each printhead having a plurality of marking elements arranged in a row, the first printhead being provided for delivering only first droplets of a single volume of printing material of ~~that a first colour with a first volume~~ and the second printhead being provided for delivering only second droplets of a single volume of printing material of ~~that a second colour with a second volume~~, the single volume of said

PATENT

first droplets and the said second volume being different from each other, and

a drive system to drive said at least first printhead and second printhead with a frequency so that a pixel to be created with said first and second droplets is formed by depositing ~~merging-together~~ said first and second droplets exactly on the same place on a position of said pixel on the printing medium.

9. (canceled)
10. (original) Method of extending a printer lifetime of a printer according to claim 8, wherein if a marking element of a printhead for a specific colour is defective, printing with this marking element is replaced by printing with a corresponding marking element from another printhead for that specific colour.
11. (original) Method of preventing image artefacts when printing with a printer according to claim 8, wherein if a marking element of a printhead for a specific colour is defective, printing with this marking element is alternated with or replaced by a dithering pattern formed by printing with a corresponding marking element on a second printhead for that specific colour.
12. (original) Method of preventing image artefacts when printing with a printer according to claim 8, wherein if a marking element of a printhead for a specific colour is defective, a dithering pattern is used including marking elements from the printhead and from another printhead for that specific colour, the position of the marking elements used corresponding to or neighbouring the defective marking element.
